"Nucleotide sequences of Dictyostellum discoideum developmentally
"Nucleotide sequences of Dictyostellum discoideum developmentally
asparagine, glutamine, or threonine.";
Mol. Gen. Genet. 218:453-459 (1989)
-!- DEVELOPMENTAL STAGE: The concentration of AAC-rich mRNAs is low
in dormant spores and growing cells, but increases during
spore-germination and multicellular development.
-!- MISCELLANEGUS: Several proteins derive from AAC-rich mRNA, which,
due to a frameshift also have ACA and CAA codons and thus are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dictyostelium discoideum (Slime mold).

Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 17352; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

a

```
sequence and an oligonuclectide comprising a sequence complementary to a polynuclectide which comprises a 3'-end sequence, where the oligonuclectide comprises at 3'-end sequence, where the chief sequence, and the combination of the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are also useful for the AHH3632 to AAHH3632 represent human amino acid sequences; and AAHH3629 to AAHH3632 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

The invention relates to identifying (M1) a candidate p53 pathway condulating agent, by contacting an assay system comprising a purified HW modulating agent, by contacting an assay system comprising a purified HM polyapetide (human orthologue of genes that modify the p53 pathway in Drosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference activity, and detecting a test agent, the system provides a reference contacting a cell defecting a test agent, the system provides a reference contacting a cell defecting a test agent, the system ordinate activity of the assay system. The specifically binds to a HM polypeptide comprising and manualian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic cacid) and diagnosing (M4) a disease in a patient (comprising contacting the sample with a probe for HM contacting the sample with a probe for HM comprision indicates a likelihood disease). (M1) is useful for identifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 * expression level. Contacting the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 * expression level. Contacting the p53 pathway of a cell the proposition of the cell, so that the cell undergoes normal contacting the p53 pathway of a cell, thus restoring the p53 pathway of a cell undergoes normal p53 pathway of a cell undergoes normal p53 pathway work as angiogenic, appoint or cell proliferation or progression through the cell cycle. (M2) and (M3) are also useful for treating defects in the p53 pathway such as angiogenic, approached the mann of a pathway modifying modification discorder in the p53 pathway such as angiogenic, and pathway modifying modification and p53 pathway modified th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

The present invention describes a predictor set comprising a plurality of the present invention describes whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase protein tyrosine kinase activity or members of the protein tyrosine kinase protein pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of determining whether the cells comprising obtaining a sample of cells, correlating the expression of the markers to the compound's ability to modulate the activity of the Cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels

correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymuclectides and polypeptides that predict compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of a microarray of polymuclectides or polypeptides, and selecting polymuclectides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of the microarray. The polymuclectides and polypeptides are useful in predicting the polymuclectides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining disease sentivity in patients to allow the development of individualized sentity in patients to allow the development of individualized cancer) based on patient response at a molecular level. The present cancer is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            410

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABP54131-ABQ56305), and also encompasses polypeptides 90% identical and polypucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens. Or ovarian antigens and the use of ovarian antigens polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast of pregnancy, anovulation, polyovitic ovary syndrome, ovarian cysts, and dysmenorines of polyovitic ovary syndrome, ovarian cysts, and dysmenorines of polyovitic ovary syndrome, ovarian or present of pregnancy, anovulation, polyovitic ovary syndrome, ovarian cysts, and dysmenorines, endocrine disorders, infections (e.g., congenital and acquired immunodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders cand urninary system disorders. Ovarian antigen polypucleotides and polymucleotides may also be used in screening for compounds which enterty of the process of the polymucleotides may the process.
Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and theis polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher elekaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABS72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (1) selected from a polypeptide having a sequence selected from 24 sequences (ABP5121-ABP51484) given in the specification, a naturally occurring polypeptide comprising a sequence in munospanic fragment of (1). (1) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound for specifically binds (1) or modulates the activity of (1), and for preparing a polyclonal or monoclonal antibody by hybridoma technology.

Nucleic acids (11) (ABQ7244-ABQ7200) encocing (1) are useful for screening a compound for effectiveness in altering expression of a target polynucleotide comprising. Oligonucleotides and antibodies are useful for expression of moder in a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the composition of MDDT in a sample. A composition comprising (1), an a sample, for detecting (1), in a sample. A composition comprising (1), an a sample, for treating a disease or condition and for purifying (1) from a sample, for detecting (1), in a sample. The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and oaid sequences. ABG00010-ABG30377 represent novel human diagnostic mainto acid sequences. ABG00010-ABG30377 represent novel human diagnostic parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the widences

                                                                                                                                                    셤
                                                                      ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA0013410) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polynpeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopoiesis regulating activity, itsue growth factor activity, haematopoiesis regulating activity, itsue growth factor activity, manunomodilatory activity and activity, insue growth factor activity, manunomodilatory activity and activity, insue growth factor activity, manunomodilatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                            480

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence to set in the interest and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                  309
                                                                                                                                                                                                                                                369

Sequence 535

```
The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR513903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a balt and isolating the set of protein explainable by using a protein as a balt and isolating the set of protein up to 30 distinct proteins. Protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note in sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           44 NVGGALRVPGA---ISEKQLEELLNQLNGTSDDPVPYTFSCTIQGKKASDPVKTIDITDN 100

New human intracellular signaling molecules (INTSIG)), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant INTSIG expression e.g. cancer, diabetes, epilepsy, c infections

Claim 1; Page 225-226; 367pp; English.

The invention relates to 45 human intracellular signalling molecules (INTSIG), INTSIG-45, and the cDNAs encoding them (ADA13319-ADA13408). The invention also encomprissing an INTSIG nocletc acid sequence the recombinant preparation of a INTSIG; an antibody against a INTSIG; methods of detection of INTSIG proteins or nucleic acids; a micro-array containing INTSIG acids; methods of screening compositions computation of INTSIG proteins or nucleic acids; a micro-array containing INTSIG acids; to receive a composition composition acids; an arranged for their ability to modulate INTSIG activity or expression; and pharmaceutical compositions comprising an INTSIG protein, nucleic acids or preventing a variety of disorders, including cell proliferative disorders (e.g., cancer or atherosclerosis); autoimmune/inflammatory disorders (e.g., cancer or atherosclerosis); autoimmune/inflammatory disorders (e.g., AIDS, allergies, anaemia, asthma, bronchitis, gout, multiple cylematosis, osteoarthritis, rheumatoid arthritis, or systemic lupus erythematosus); neurological disorders (e.g., epilapsy, stroke, allergies, anaemia, asthma, disparsing, creating or anaemia, asthma, bronchitis, or systemic lupus erythematoral disorders (e.g., epilapsy, stroke, allergies, anaemia, asthma, asthma, pronchitis, or systemic lupus erythematoral disorders (e.g., epilapsy, stroke, allergies, anaemia, or parkinson's disease, allergies, anaemia, asthma, pronchitis, or systemic lupus disorders (e.g., disorders of the hypothalamus or pituitary gland or diabetes); reproductive disorders, or vesicle-trafficking disorders (e.g., cystic fibrosis or hypercholesteroleemia). The present sequence represents an INTSIG protein of the invention. disorders (e.g., epilepsy, stroke, Alzheimer's disease, dementia, or Parkinson's disease); developmental disorders (e.g., achondroplastic dwarfism, Cushing's disease, hypothyroidism or hydrocephalus); endoor protozoan or helminthic infections; neurological dwarfism, Cushing's disease, fungal, parasitic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DINSOGRCINILKSHAHWVNHLSLSTDYALRIGAFDHTGKKPSTPEEAQKKALENYEKIC 364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -NNPNANLMLASASFDSTVRLWDVDRGI-CIHTLIKHQEPVYSVAFSPDGRYLASGSFDK 464
involved in intracellular signalling. An example of such an interaction is between protein kinase C and receptors of activated protein kinase (RACK), esp. RACK-1 (RAR85850). Proteins AAR85851-82 were isolated based on homology with beta-transducin, whereas proteins AAR85882-92 were isolated based on homology with the WD-40 consensus sequence (AAR85893). The proteins were used to construct the poptides AAR84928-R85063 and AAR85786-R85842. The peptides can be used to identify target proteins proteins involved in protein-protein interaction and to screen for drugs that will affect protein interaction involving WD-40 domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ---PIESLSLIDA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            93
                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insectioides, therapeutics and pharmaceutical dargs. The invention discloses genomic DNA sequences (ABL16176-ABL3611), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABR3721). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      77
                                                                                                 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB27072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     164 LLASCSADLSIKLWDFQQSYECIKTWHGHDHNVSSVAFVPAGDYVLSASRDRTIKWWEVA

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
